CO2 Footprint Tracker

1. **Project Brief:**
   The CO2 Footprint Tracker is designed to empower individuals to understand, monitor, and reduce their carbon footprint. As sustainability becomes increasingly essential, people want to be mindful of how their daily choices impact the environment. Our software focuses on tracking CO2 emissions generated through mobility, diet, and consumer behavior, providing a detailed analysis of these lifestyle areas. By visualizing their emissions and offering actionable suggestions, users can make data-driven decisions to lead a more sustainable lifestyle.

- **Purpose**: The CO_2 Footprint Tracker is designed to help individuals understand, monitor, and reduce their carbon footprint effectively.
- **Sustainability Focus**: With sustainability becoming increasingly vital, people are more conscious of how their daily choices impact the environment.
- **Tracking Key Areas**: Our software tracks CO_2 emissions across three major lifestyle areas: mobility, diet, and consumer behavior.
- **Detailed Analysis**: By analyzing these lifestyle aspects, users gain insights into the sources of their emissions.
- **Visualization and Actionable Insights**: The tool visualizes users' emissions and provides actionable suggestions, enabling them to make informed, data-driven decisions to live more sustainably.

2. **Target Group:**

- The primary users are environmentally conscious individuals who seek to monitor and reduce their carbon footprint.
- This tool serves people who are not only aware of environmental issues but are also motivated to take action.
- Our application addresses the challenge of providing an easy-to-use, reliable way to log, understand, and act on CO2 emissions data, making it practical for users to minimize their environmental impact.

3. **Key(Core) Features:**

- Configure Lifestyle Attributes:

Users can set their typical lifestyle choices, such as transportation modes, diet preferences, and general consumer habits. This baseline setup ensures that the data is personalized, allowing the CO2 calculations to reflect real lifestyle choices.

- Daily Activity Logging:

Users record daily activities, such as miles driven, types of meals consumed, and shopping habits. Each activity type has an associated CO2 emission value, enabling us to calculate daily emissions precisely.

- Analysis Dashboard:

The application offers an analysis dashboard that visualizes emissions by category (e.g., transportation, diet) and over chosen time frames, such as weekly, monthly, or annually. Users can track trends over time, which can be a powerful motivator for positive change.

- Optimization Suggestions:

Based on the recorded data, the software provides suggestions tailored to each user's lifestyle. For instance, it might suggest reducing meat consumption or choosing public transportation over personal vehicles based on individual activity logs.

- Competitive Advantage:

Unlike other carbon calculators, which often provide a one-time assessment, our CO2 Footprint Tracker is a dynamic tool. By incorporating daily tracking and personalized recommendations, it goes beyond standard calculators. The ongoing data collection allows for tailored insights and the ability to visualize lifestyle changes, giving users an interactive and evolving experience in CO2 tracking and reduction.
